## Senior Cycle

Senior cycle aims to educate the whole person and contribute to human flourishing. Students' experiences throughout senior cycle enrich their intellectual, social and personal development and their overall health and wellbeing. Senior cycle has 8 guiding principles.

### Senior Cycle Guiding Principles

Wellbeing and relationships

Inclusive education and diversity

Challenge, engagement and creativity

Learning to learn, learning for life

Choice and flexibility

Continuity and transitions

Participation and citizenship

Learning environments and partnerships

These principles are a touchstone for schools and other educational settings, as they design their senior cycle. Senior cycle consists of an optional Transition Year, followed by a two-year course of subjects and modules. Building on junior cycle, learning happens in schools, communities, educational settings, and other sites, where students' increasing independence is recognised. Relationships with teachers are established on a more mature footing and students take more responsibility for their learning.

Senior cycle provides a curriculum which challenges students to aim for the highest level of educational achievement, commensurate with their individual aptitudes and abilities. During senior cycle, students have opportunities to grapple with social, environmental, economic, and technological challenges and to deepen their understanding of human rights, social justice, equity, diversity and sustainability. Students are supported to make informed choices as they choose different pathways through senior cycle and every student has opportunities to experience the joy and satisfaction of reaching significant milestones in their education. Senior cycle should establish firm foundations for students to transition to further, adult and higher education, apprenticeships, traineeships and employment, and participate meaningfully in society, the economy and adult life.

The educational experience in senior cycle should be inclusive of every student, respond to their learning strengths and needs, and celebrate, value, and respect diversity. Students vary in their family and cultural backgrounds, languages, age, ethnic status, beliefs, gender, and sexual identity as well as their strengths, needs, interests, aptitudes and prior knowledge, skills, values and dispositions. Every student's identity should be celebrated, respected, and responded to throughout their time in senior cycle.

At a practical level, senior cycle is supported by enhanced professional development; the involvement of teachers, students, parents, school leaders and other stakeholders; resources; research; clear communication; policy coherence; and a shared vision of what senior cycle seeks to achieve for our young people as they prepare to embark on their adult lives. It is brought to life in schools and other educational settings through:

- effective curriculum planning, development, organisation, reflection and evaluation
- teaching and learning approaches that motivate students and enable them to improve
- a school culture that respects students and promotes a love of learning.

## Rationale

**Leaving Certificate science education** provides a means by which students can investigate the natural world to foster an evidence-based understanding of how it works. Students learn that science as a discipline is a process that requires logic and creativity to construct scientific knowledge through the sharing of ideas and by developing, refining, and critically analysing these ideas. Students experience science as a personal and collaborative activity that is exciting, challenging and powerful in transforming the world in which we live.

Within the sciences, **Physics** attempts to develop a unified description of how matter and energy behave and interact with each other. The Universe is composed of a wide variety of simple and complex systems and physics attempts to describe these systems in terms of all- embracing fundamental concepts. In its search for basic laws and general principles, physics encompasses the study of the universe from the smallest subatomic particles to the largest galaxies. It involves asking fundamental questions and trying to answer them by observing, measuring, experimenting and developing models to explain the physical world. Physics is progressive, new data may answer some questions but raise others and this makes physics exciting and interesting.

Physicists are problem solvers, the analytical and practical skills developed by students of Leaving Certificate Physics opens a wide variety of opportunities in many fields.

## Aims

The aim of Leaving Certificate Physics is to provide students with an experience that develops their interest in and enthusiasm for physics. In doing so, it aims to build the knowledge, skills, values and dispositions necessary for students to become scientifically literate citizens who are well-prepared for the challenges and opportunities of their future, embracing life-long learning and sustainable living, as citizens in a technologically developing society.

More specifically Leaving Certificate Physics, aims to empower students to:

- build knowledge and understanding of specified core concepts and fundamental principles of physics
- develop the skills, values and dispositions needed to apply this knowledge to explain, analyse, solve problems and predict events in a variety of systems and interactions in the physical world
- demonstrate inquiry and practical skills consistent with the principles and practices of physics
- understand how society and science are interwoven, the everyday relevance and the ethical implications of physics.

# Continuity and progression

## Junior Cycle

The learning at the core of junior cycle is described in the Statements of Learning, a number of which apply to scientific concepts, processes and practices, including problem-solving, design and communication skills, and to understanding and valuing the role and contribution of science and technology to society. Student learning in science is unified through the Nature of Science strand, which emphasises the development of a scientific habit of mind.

There is an emphasis on inquiry through which learners develop an understanding and appreciation of structures, processes and fundamental concepts that are essential to all science, as well as the ability to apply scientific principles to their everyday lives. All of the key skills developed across the curriculum during junior cycle support student learning in senior cycle. Many junior cycle subjects and short courses have close links with and support the learning in junior cycle science, particularly mathematics, geography, CSPE, PE, SPHE, home economics and the technology subjects.

Junior Cycle Science has close links with Leaving Certificate Physics in helping students to continue to develop their evidence-based understanding of the natural world; to develop their capacity to gather and evaluate evidence: to consolidate and deepen their skills of working scientifically; to make them more self-aware as learners and to become more competent and confident in their ability to use and apply science in their everyday lives. Students build on these scientific concepts, processes and practices as they progress through the two years of Leaving Certificate Physics.

## Beyond senior cycle

Physics builds a solid foundation for students to progress to diverse futures, including participation in society and the world of work, further education and training, and higher education, in specialised areas such as science, engineering, technology-related jobs, computer science, education, mathematics, medicine, business and finance.

In addition, physics incorporates a broad range of skills, including, logical thinking, creative design, synthesis and evaluation. It teaches a range of generically useful skills in areas such as problem-solving, communication, time management, organisation, and teamwork. These skills are relevant to all further study, and indeed all learning beyond formal education.

Many important challenges facing society—energy demands, providing sufficient food and water, climate change and disease control—require major contributions from the scientific community. These challenges require not only innovative science solutions, but also social, political and economic ones that are informed by knowledge of the science that underpins the challenges.

The spread of disinformation is threatening democracies world-wide. Rationality and scepticism are important principles embedded in Leaving Certificate Physics. Students learn the importance of reliable sources, peer review, ethics and evidence in logical decision-making and are well poised to address these challenges.

## Student learning in senior cycle

Student learning in senior cycle consists of everything students learn **within** all of the subjects and modules they engage with **and** everything students learn which spans and overlaps **across** all of their senior cycle experiences. The overarching goal is for each student to emerge from senior cycle more enriched, more engaged and more competent as a human being than they were when they commenced senior cycle.

For clarity, the learning which spans **across** all of their senior cycle experiences is outlined under the heading 'key competencies'. The learning which occurs **within** a specific subject or module is outlined under the heading 'strands and learning outcomes'. However, it is vital to recognise that key competencies and subject or module learning are developed in an integrated way. By design, key competencies are integrated across the rationale, aims, learning outcomes and assessment sections of specifications. In practice, key competencies are developed by students in schools via the pedagogies teachers use and the environment they develop in their classrooms and within their school. Subjects can help students to develop their key competencies; and key competencies can enhance and enable deeper subject learning.

When this integration occurs, students stand to benefit

- during and throughout their senior cycle
- as they transition to diverse futures in further, adult and higher education, apprenticeships, traineeships and employment, and
- in their adult lives as they establish and sustain relationships with a wide range of people in their lives and participate meaningfully in society.

When teachers and students make links between the teaching methods students are experiencing, the competencies they are developing and the ways in which these competencies can deepen their subject specific learning, students become more aware of the myriad ways in which their experiences across senior cycle are contributing towards their holistic development as human beings.

## Key competencies

Key competencies<sup>1</sup> is an umbrella term which refers to the knowledge, skills, values and dispositions students develop in an integrated way during senior cycle.

**Figure 1:** The components of key competencies and their desired impact

The knowledge which is specific to this subject is outlined below under 'strands of study and learning outcomes'. The epistemic knowledge which spans across subjects and modules is incorporated into the key competencies.

<sup>1</sup>These are sometimes also referred to as capacities, or capabilities.

**Figure 2:** Key Competencies in Senior Cycle, supported by literacies and numeracy.

These competencies are linked and can be combined; can improve students' overall learning; can help students and teachers to make meaningful connections between and across different areas of learning; and are important across the curriculum.

The development of students' literacies and numeracy contributes to the development of competencies and vice-versa. Key competencies are supported when students' literacies and numeracy are well developed and they can make good use of various tools, including technologies, to support their learning.

The key competencies come to life through the learning experiences and pedagogies teachers choose and through students' responses to them. Students can and should be helped to develop their key competencies irrespective of their past or present background, circumstances or experiences and should have many opportunities to make their key competencies visible. Further detail in relation to key competencies is available at <https://ncca.ie/en/senior-cycle/senior-cycle-redevelopment/student-key-competencies/>

The key competencies can be developed in Leaving Certificate Physics in a range of ways.

## Thinking and solving problems

Students use critical thinking and problem-solving skills to demonstrate an understanding of scientific principles underlying the solutions to inquiry questions and problems posed in investigations.

Appropriate and varied strategies are employed, including the use of models to qualitatively and quantitatively explain and predict cause-and-effect relationships. As they work like scientists, students synthesise and use evidence to construct and justify conclusions. To solve problems, students interpret scientific and media texts, evaluate processes, claims and conclusions and consider the quality of available evidence.

## Communicating

Effective communication skills are developed through collaborative practical work. Students communicate qualitative and quantitative information gained from investigations using primary and secondary sources, digitally, visually, written and/or verbally as appropriate. They apply appropriate scientific notations and nomenclature and use scientific language appropriate for specific audiences and contexts.

## Working with others

Leaving Certificate Physics is underpinned by collaboration and working with others. Students gain some appreciation of group dynamics and the social skills needed to engage in collaborative practical work. This contributes to an appreciation that working collectively can energise a group, help motivation, and capitalise on all the talents in the group. One of the most beneficial outcomes of working with others is in identifying, evaluating and achieving collective goals. Students learn to negotiate and resolve differences of opinion as they discuss their different strategies and achieve compromise.

## Managing learning and self

This competency contributes to the personal growth of students: they become more self-aware and use this awareness to develop personal goals. An important dimension of this competency is in building the know-how of students to recognise how to get things done, how to garner and use resources effectively, and how to act autonomously. Students must develop confidence in their self-direction and exhibit tenacity and rigour. To manage learning and themselves, students must build on the metacognitive dimension of knowledge, whereby they develop strategies to learn and to build on previous knowledge.

## Literacies and numeracy

Literacies and numeracy support the development of key competencies in the Leaving Certificate Physics classroom, and vice-versa. Students have opportunities to use the most appropriate and meaningful methods and media to organise and analyse data and information sources, including digital technologies and the use of a variety of visual representations as appropriate. They process both qualitative and quantitative data from primary<sup>2</sup> and secondary sources.

Students identify trends, patterns and relationships; recognise error, uncertainty and limitations in data; and interpret scientific and media texts. They evaluate the relevance, accuracy, validity and reliability of the primary or secondary-sourced data in relation to investigations. They evaluate processes, claims and conclusions by considering the quality of available evidence, and use reasoning to construct scientific arguments.

<sup>2</sup> Primary data; data gathered first-hand through experimentation by the student.

## Strands of study and learning outcomes

This Leaving Certificate Physics specification is designed for a minimum of 180 hours of class contact time. It sets out the learning in strands and through the identification of cross-cutting themes. There are five strands; a unifying strand, The Nature of Science, and four contextual strands, Forces and Motion, Wave Motion and Energy Transfer, Electricity and Magnetism, and Modern Physics.

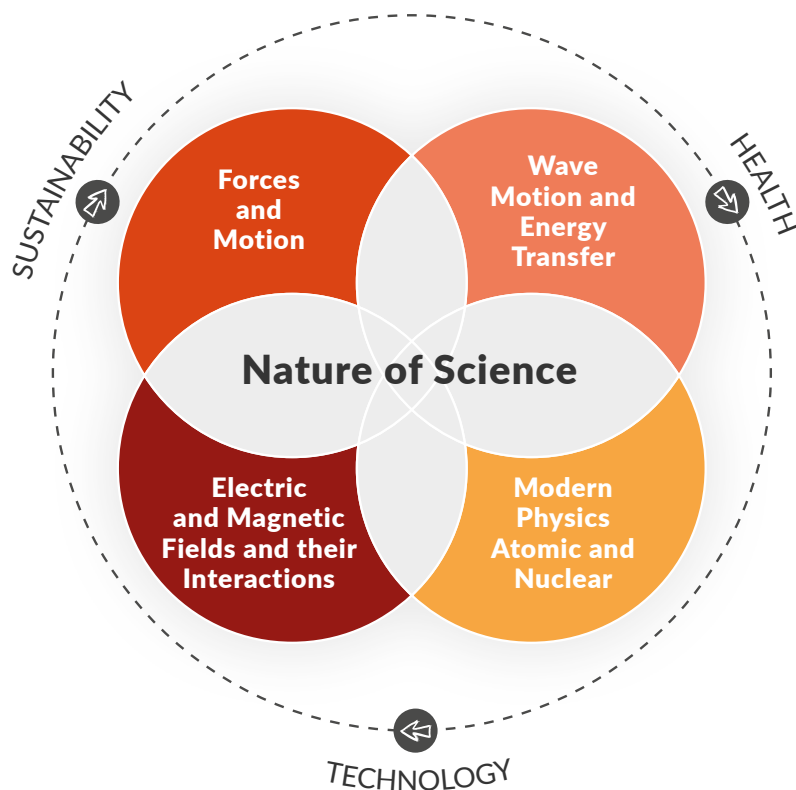

Figure 3: Overview of Leaving Certificate Physics

The Nature of Science underpins physics and so is considered a unifying strand (Figure 3); it permeates all the strands of the specification. The learning outcomes in this strand identify the knowledge, skills and values related to scientific practices which are essential to students' learning about science throughout the course, underpinning the activities and content in the other strands.

The learning outcomes in the other four contextual strands—Forces and Motion, Wave Motion and Energy Transfer, Electric and Magnetic Fields and their Interactions, and Modern Physics—identify the

knowledge of physics; i.e. the core concepts, models and theories that describe, explain and predict physical phenomena.

The specification identifies three cross-cutting themes—Technology, Health and Sustainability—to act as lenses through which students explore the application of the knowledge from physics. Through these lenses they pose questions, examine the benefits of applications of the core concepts, models and theories to individuals, the community and the environment, and evaluate associated risks and any unintended consequences.

An overview of each strand is provided below, followed by a table. The right-hand column contains learning outcomes which describe the knowledge, skills, values and dispositions students should be able to demonstrate after a period of learning. The left-hand column outlines specific areas that students learn about. Taken together, these provide clarity and coherence with the other sections of the specification.

Ordinary level	Higher level
<ul style="list-style-type: none"> <li>Only the learning outcomes that are presented in normal type.</li> <li>Students engage with a broad range of knowledge, mainly concrete in nature, but with some elements of abstraction or theory.</li> <li>Students demonstrate and use a moderate range of cognitive skills and tools and select from a range of procedures and apply known solutions to a variety of problems in both familiar and unfamiliar contexts.</li> <li>Students demonstrate and use scientific literacy skills when selecting evidence and data to communicate findings and draw conclusions to questions posed by themselves and others.</li> </ul>	<ul style="list-style-type: none"> <li>All learning outcomes including those <b>in bold type</b>.</li> <li>Students engage with a broad range of knowledge, including theoretical concepts and abstract thinking with significant depth in some areas.</li> <li>Students demonstrate and use a broad range of specialised skills to evaluate, and use information, to plan and develop investigative strategies, and to determine solutions to varied, unfamiliar problems. They identify and apply skills and knowledge in a wide variety of both familiar and unfamiliar contexts.</li> <li>Students demonstrate and use scientific literacy skills when presenting appropriate evidence and data to effectively communicate findings and draw valid justified conclusions to questions posed by themselves and others.</li> </ul>

**Table 1:** Inclusivity in design of learning outcomes

Learning outcomes should be achievable relative to students' individual aptitudes and abilities. Learning outcomes promote teaching and learning processes that develop students' knowledge, skills, values and dispositions incrementally, enabling them to apply their key competencies to different situations as they progress. Students studying at both Ordinary level and Higher level will critically engage with physics, but the context, information and results arising from that engagement will be different.

Appendix 1 sets out a glossary of action verbs used in the Learning Outcomes.

## Unifying Strand: The Nature of Science

This strand builds on the unifying strand from Junior Cycle Science and continues to bring to life the practices and norms underpinning the facts, concepts, laws, and theories of science. Building on existing knowledge, students develop an appreciation of science as a process; a way of knowing and doing and an awareness that the discipline of science includes the nature of scientific knowledge as well as how this knowledge is generated, established and communicated. In senior cycle it is expected that students will be able to meet these learning outcomes with a greater degree of independence.

As they learn to work like scientists, they develop a habit of mind that sees them rely on a set of established procedures and practices associated

with scientific inquiry to gather evidence, generate models<sup>3</sup> and test their ideas on how the physical world works. It becomes apparent that the process of science is often complex and iterative, following many different paths. Students will learn to obtain and evaluate primary data (i.e., collected by themselves) and secondary data (data collected by somebody else).

Students develop an understanding that whilst science is powerful, generating knowledge that forms the basis for many advances and innovations in society, it has limitations and that the application of scientific knowledge to problem solving can be influenced by considerations such as economic, social, sustainability and ethical factors.

### Unifying Strand Learning outcomes

#### Students learn about

##### U1. Scientific knowledge

- the nature of scientific knowledge
- science as a global enterprise that relies on openness, clear communication, international conventions, peer review and reproducibility
- recognising bias

##### U2. Investigating in science

- questioning and predicting
- objectivity

#### Students should be able to

1. appreciate how scientists work and how scientific ideas are modified over time
2. conduct research relevant to a scientific issue, evaluate different sources of information including secondary data, understanding that a source may lack detail or show bias

1. recognise and pose questions that are appropriate for scientific investigation
2. pose testable hypotheses developed using scientific theories and explanations, and evaluate and compare strategies for investigating hypotheses

<sup>3</sup> Representations of a system or phenomenon that can be words, diagrams, numbers, graphs and equations

## Students learn about

- identifying potential sources of random and systematic error
- evaluating data in terms of accuracy, precision, repeatability and reproducibility
- distinguishing between fundamental and derived units, using SI units, prefixes and powers of ten for order of magnitude, converting units and using an appropriate number of significant figures in calculations
- communicating results to a range of audiences

### U3. Science in society

- evaluating evidence for relevance, accuracy, bias
- relating science to society by considering economic, social, sustainability and ethical factors

### U4. Modelling in Physics

- generating and using models
- the evolving nature of models
- verifying models

### U4. Unit analysis

- dimensional/unit analysis
- making order of magnitude estimates

## Students should be able to

3. design, plan and conduct investigations; explain how reliability, accuracy, precision, error, fairness, safety, integrity, and the selection of suitable equipment have been considered
4. produce and select data (qualitatively/quantitatively), critically analyse data to identify patterns and relationships, identify anomalous observations, draw and justify conclusions
5. review and reflect on the skills and thinking used in carrying out investigations, and apply their learning and skills to solving problems in unfamiliar contexts
6. organise and communicate their research and investigative findings in a variety of ways fit for purpose and audience, using relevant scientific terminology and representations

1. evaluate media-based arguments concerning science and technology
2. research and present information on the contribution that scientists make to scientific discovery and invention, and evaluate its impact on society

1. appreciate that models
  - are simplified representations of complex systems or phenomena with underlying assumptions
  - can be modified as more data becomes available from the system/phenomenon
  - can predict the behaviour of a system/phenomenon
2. make connections between mathematical representations of a system and data about the system obtained from that system with integrity through reliable, accurate, and precise observation and safe and fair experiment

1. evaluate and articulate whether an answer is reasonable by analysing the dimensions / units and the order of magnitude

## Strand 1: Forces and Motion: Kinematics and Dynamics

In this strand, students learn about Newtonian mechanics as a successful physical theory that explains the motion of objects. They explore how objects move (kinematics) and the reason why objects move in the way they do (dynamics). They use the verbal, mathematical and graphical language of kinematics to discuss and explain motion in one dimension as well as motion in a circle.

They are introduced to Newton's three laws of motion as valid mathematical models with underlying assumptions that accurately model systems as diverse as the planets of the solar system and helium atoms in a container. They learn how experiments and observations have confirmed the validity of Newtonian mechanics in many circumstances, but that the validity breaks down for objects moving close to the speed of light, or objects at the subatomic scale. In strand 4 they will learn how quantum mechanics is a more appropriate model when considering objects at the subatomic scale.

Given the central role that forces play in Newton's laws of motion, students explore forces common in everyday life such as weight, tension, friction, buoyancy and air resistance. They learn how to

model a situation in which more than one force is acting on an object and how to find the resultant of those forces. In strands 2 and 3 they will see how many of these everyday forces can also be modelled as gravitational and electromagnetic interactions, two of the four fundamental forces in nature.

The concept of energy as one of the most fundamental concepts in science, is considered in the context of Newtonian mechanics. Students understand that conservation of energy is an essential principle in physics and explore how the concept of work, as a means of transferring energy through the application of a force, links energy and force. They learn how in certain situations, the concepts of work and energy can be applied to solve the dynamics of a mechanical system without directly resorting to Newton's laws. Students learn how this work-energy approach often provides a much simpler analysis than that obtained from the direct application of Newton's Laws since it deals with scalar rather than vector quantities. Beyond this strand, they learn how this problem-solving approach focusing on energy can be applied to a range of phenomena in electromagnetism, and thermal and nuclear physics.

### Strand 1 Learning outcomes

#### Students learn about

##### 1.1. Particle motion in a straight line

- basic concepts for describing the motion of a particle; displacement, velocity, acceleration and time.
- relationships between the concepts;  
$$v = \frac{\Delta s}{\Delta t} \quad a = \frac{\Delta v}{\Delta t}$$

#### Students should be able to

1. model motion of a particle in a straight line
2. investigate constant and varying linear motion using primary and secondary data

## Students learn about

- graphical representation and interpretation: displacement-time graphs, velocity-time graphs
- the kinematics equations under constant acceleration
$$v = u + at$$
$$s = ut + \frac{1}{2}at^2$$
$$v^2 = u^2 + 2as$$
- identifying and representing scalar and vector quantities
- resolving vectors into perpendicular components**
- calculating the resultant of two vectors**

### 1.2. Forces acting on a particle

- Newton's 3 laws of motion
- the concepts of mass, centre of mass and a force as a vector quantity
- types of forces: Normal, Frictional, Resistant, Tension, Buoyancy, Gravitational
- resultant force as the sum of all forces
- $P = \frac{F}{A}$ ; in fluids  $P = h\rho g$
- the concept of density  $\rho = \frac{m}{v}$
- the concept of momentum  $p = mv$
- collisions as governed by Newton's laws of motion and by conservation of momentum

## Students should be able to

### 3. derive the kinematic equations

### 4. verify the law of addition of vectors using primary and secondary data in one and two dimensions

### 1. model real-world situations using Newton's laws of motion

### 2. verify Newton's 2nd law of motion

$$F_{net} = ma$$

using primary and secondary data

### 3. model problems involving the motion of a particle under a constant resultant force

### 4. solve problems relating to solids resting on a surface and pressure within fluids

### 5. investigate density

### 6. investigate the principle of conservation of momentum using primary and secondary data

### 7. verify using secondary data that collisions are governed by Newton's laws of motion

### 8. model direct collisions in one dimension **and in two dimensions using perpendicular and parallel components**

## Students learn about

### 1.3. Stretching and compressing objects

- stretching and compressing objects
  - Hooke's law;  $F = -ks$

### 1.4. A work-energy model for analysing particle motion

- $E_p = mgh$
- $E_k = \frac{1}{2}mv^2$
- $W = Fs$
- $P = \frac{W}{t}$
- Work done in stretching or compressing**  
 $E_p = \frac{1}{2}ks^2$
- the principle of conservation of energy

### 1.5. Forces acting in a gravitational field

- mathematical models for  $g$  the acceleration due to gravity  
 $g = 4\pi^2 \frac{l}{T^2} \quad g = \frac{2s}{t^2} \quad g = \frac{Gm}{r^2} \quad g = \frac{P}{h\rho}$

- Newton's law of Universal Gravitation as an inverse square law

$$F = \frac{Gm_1 m_2}{r^2}$$

$$v_e = \sqrt{\frac{2GM}{r}}$$

## Students should be able to

- investigate the force needed to compress or stretch an object using primary and secondary data
- verify Hooke's law for elastic objects using primary and secondary data
- solve problems involving compressed and stretched materials

- define work done by a constant force
- model real life situations describing gravitational potential energy, **elastic potential energy**, kinetic energy, work done and the rate of doing work
- solve problems involving compressed and stretched materials**
- investigate the principle of conservation of energy using primary and secondary data
- apply the principle of conservation of energy to real life situations

- verify at least one model to determine  $g$  using primary data and all four using secondary data

- model the gravitational field strength at any point in a gravitational field, including at the surface of a planet

- calculate escape velocity from celestial bodies**

Students learn about

Students should be able to

### 1.6. Uniform circular motion

- the centripetal force required to maintain uniform motion in a circle

$$F = \frac{mv^2}{r}$$

- evidence that the force of gravity meets the centripetal force requirements for planetary motion

$$T^2 = \frac{4\pi^2 R^3}{GM}$$

- relate the orbits of satellites to their uses

- explain centripetal force
- model the dynamics of an object moving in a circle with constant angular velocity
- verify Kepler's 3rd law using secondary data
- model situations involving the orbits of planets and satellites in near Earth and geostationary orbits

## Strand 2: Wave Motion and Energy Transfer

In this strand, students are introduced to energy transfer in a number of ways. They categorise different types of waves and explore the distinguishing features of each. They are introduced to the anatomy of a wave and associated vocabulary and mathematical relationships.

Students further explore electromagnetism as one of the four fundamental forces of nature. They are introduced to the electromagnetic spectrum, a special family of radiation travelling at the speed of light as a stream of photons with wave-like properties, and identify the members of this family by wavelength and frequency. The exploration of infra-red radiation provides an opportunity for students to look at the concept of heat transfer in more detail and offers a segue to the exploration of a particle model to make sense of the phenomenon of conduction and convection, describe observations from real life and make predictions about behaviour.

As they explore energy transfer through a variety of mediums, they explore boundary behaviour and are introduced to wave phenomena common to different categories of waves. Having used words, diagrams graphs and equations to describe the behaviour of waves, students apply this learning to real- life situations involving energy transfer. They apply their understanding of motion from strand 1 to make sense of the particle model of matter in relation to the transfer of heat energy between and within systems by conduction and convection.

They plan to fairly collect primary data and analyse secondary data, to verify observations and mathematical relationships and solve problems using these relationships.

### Strand 2 Learning outcomes

#### Students learn about

##### 2.1. The transfer of heat energy and temperature change

- a definition of temperature
- thermometric properties of materials
- thermometer as a device
- the Kelvin and Celsius temperature scales
- relationships between heat energy and temperature change
  - heat capacity:  $C = \frac{Q}{\Delta\theta}$
  - specific heat capacity:  $c = \frac{Q}{m\Delta\theta}$

#### Students should be able to

1. analyse the suitability of materials for use as thermometers using primary and secondary data
2. determine specific heat capacity using primary data (solid or liquid) and secondary data (solid *and* liquid)

## Students learn about

- latent heat:  $L = Q$
- specific latent heat:**  $l = \frac{Q}{m}$
- the concept of a heat pump
- particle models of heating; conduction, convection, changes of state
- the concept of efficiency  

$$\frac{P_o \times 100}{P_i}$$
- U-value as the rate of transfer of heat through a material

### 2.2. Travelling waves as models of disturbances transferring energy without transferring matter

- mechanical/electromagnetic waves longitudinal/transverse waves
- radiation
- wave characteristics: rest position, displacement, trough, crest, amplitude, wavelength, velocity, time period, frequency  

$$T = \frac{1}{f} \quad v = f\lambda \quad c = f\lambda$$
- the relationship between amplitude and energy carried by a wave
- resonance as the observed phenomenon when driving frequency = the natural frequency of vibration

### 2.3. Wave behaviour caused by the interaction of waves with their environment

- ray diagrams
- reflection  

$$i = r$$
- refraction  

$$n = \frac{\sin i}{\sin r} \quad n = \frac{c_1}{c_2} \quad n = \frac{1}{\sin C}$$
- the critical angle and total internal reflection

## Students should be able to

- determine the **specific** latent heat using primary data (vaporisation of steam *or* fusion of ice) and secondary data (vaporisation of steam *and* fusion of ice)
- verify mathematical models of heat energy, latent heat and temperature change using secondary data
- solve real life problems involving heat transfer, change of state and improving efficiency
- investigate the impact of insulation on energy consumption and sustainability using secondary sources

- model wave motion

- investigate resonance in real life situations using secondary sources

- model wave behaviour; reflection, refraction, diffraction, interference, polarisation

- verify models for refraction using primary and secondary data

## Students learn about

- converging and diverging lenses

## Students should be able to

- verify the model

$$\frac{1}{f} = \frac{1}{u} + \frac{1}{v}$$

using primary and secondary data for converging lenses and secondary data for diverging lenses

- investigate the use of optics in technological and medical contexts using secondary sources

### 2.4. Electromagnetic Energy

- electromagnetic spectrum and sources of electromagnetic energy; ionising radiation
- dispersion
- irradiance as the solar power falling on a surface per unit area:  $I = \frac{P}{A}$

- categorise electromagnetic waves by their wavelength, frequency, ionising ability and everyday use
- demonstrate dispersion and explain the phenomenon
- investigate solar irradiance and its impact on life on earth using secondary sources

### 2.5. Sound Energy

- sound energy needs a medium to travel through
- ultrasound

- examine evidence to support the mechanical wave nature of sound
- relate the pitch and loudness of sounds to their wave characteristics using observation and secondary data
- investigate the use of ultrasound in technological and medical contexts using secondary sources

### 2.6. Principle of superposition of waves

- stationary waves in strings as resulting from the interference of two waves along the same string moving in opposite directions
- common terms used to describe stationary waves: nodes, antinodes, harmonics and the fundamental frequency

- model standing waves on a stretched string
- verify the model for a particular string

$$f = \frac{1}{2l} \sqrt{\frac{T}{\mu}}$$

using primary and **secondary data**

- verify the relationship between the length of a string and the frequency of a standing wave using secondary data

## Students learn about

- coherence
- interference patterns
- **Young's slits**
  - $n\lambda = d\sin\theta$
- **the diffraction grating**

## Students should be able to

4. investigate the wave nature of light **and determine its wavelength** using primary and secondary data

### 2.7. Wave effects

- the Doppler effect

$$f' = \frac{fc}{c \pm \mu}$$

1. **model real life situations involving the Doppler effect**
2. investigate the Doppler effect in real life applications using secondary sources

## Strand 3: Electric and Magnetic Fields and their Interactions

In this strand, students are introduced to the concept of electric and magnetic fields as examples of vector fields of force and use field lines to represent the relative strength and direction of these fields. They explore evidence for electric charge as responsible for these electric and magnetic forces and fields and establish links with atomic structure, Newton's Laws of motion, and work and energy. They recognise the non-contact nature of the interaction between charged objects and explore similarities and differences with qualitative and quantitative aspects of gravitational forces. Applying a work/energy model allows them to explain electricity, from charged particles at the atomic level to the current that flows in homes and businesses.

As they examine evidence and interrogate models explaining the conductivity of materials they are introduced to semiconductors and learn to appreciate how their use has revolutionised our lives.

They learn that there are two kinds of electric currents: direct (DC) and alternating (AC). Knowing that electricity and magnetism are closely related they explore evidence that flowing electrons

produce a magnetic field, and spinning magnets cause an electric current to flow. They learn that the fundamental force electromagnetism manifests as the interaction of these two important forces; electricity and magnetism, which are integral to the workings of nearly every gadget, appliance, vehicle, and machine they use.

As they progress through the strand students appreciate how discoveries about the interactions that take place between charged particles and electric and magnetic fields from Oersted to Faraday not only produced significant advances in physics, but also led to significant technological developments. These developments include the generation and distribution of electricity, and the invention of numerous devices that convert electrical energy into other forms of energy. Whilst the law of conservation of energy underpins all of these interactions, the conversion of energy into forms other than the intended form is a problem that constantly drives engineers to improve designs of electromagnetic devices to make them more efficient and sustainable.

### Strand 3 Learning outcomes

#### Students learn about

##### 3.1. Charge interactions

- electrically neutral objects and how they become charged
- the atomic structure of matter
  - free electrons and bound electrons
- charging objects by friction / induction (single sphere); grounding
- the conservation of charge in interactions
- the distribution of charge on conductors and insulators

#### Students should be able to

1. demonstrate forces
  - between charged objects
  - between charged and neutral objects
2. classify materials as conductors or insulators
3. describe the behaviour of insulators and conductors
4. solve problems involving static electrical phenomena

**3.2. Modelling electric fields**

- the electrostatic force as an example of an inverse square law quantified as Coulomb's law

$$F = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{d^2}$$

- electric potential as work done/unit charge

$$V = \frac{W}{q}$$

- electric field strength of a point charge

$$E = \frac{F}{q}$$

- the vector nature of electric fields

$$F = qE$$

1. model the electrostatic force between point charges

2. discuss the electric field as a model for the non-contact interaction between charged objects

3. define electric field strength at a point

4. use field lines to represent the relative strength and direction of electric fields around charged objects

**3.3. Electric circuits**

- electric potential and current, work, power, potential difference, voltage and emf
  - $I = \frac{q}{t}$
  - $V = \frac{W}{q}$
  - $W = I^2 R t$
  - $P = I^2 R$
  - $P = VI$
- series and parallel circuits
- safety in mains electricity: earthing, MCBs and RCDs
- doping; n type, p type and p-n junction, depletion layer
- transistors as switches
- circuit components: voltage source, switch, light bulb, resistor, variable resistor, ammeter, voltmeter, ohm meter, diode, LDR, LED, thermistor, transistor
- resistance and resistivity
  - Ohm's law  $V = IR$
  - $R = \rho \frac{l}{A}$

1. model

- the relationship between current and charge
- the relationship between work, charge and potential difference
- the relationship between electric current, conventional current, power and resistance
- series and parallel circuits
- the rate of conversion of electrical energy in components of electric circuits
- fuses and circuit breakers

2. investigate the use of semi-conductors in real-world applications using secondary sources

3. model the relationship between current flowing through and the voltage across a diode in forward and reverse bias using primary and secondary data

4. verify the relationship between current flowing through and the voltage across an ohmic conductor using primary and secondary data

## Students learn about

- non-ohmic conductors: filament bulb, diode
- heating effect of an electric current and its implications for electrical supply
- conservation of charge and energy in a circuit
  - $R = R_1 + R_2 + R_3 \dots$
  - $\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} \dots$

## Students should be able to

5. investigate the relationship between current flowing through and the voltage across non-ohmic conductors using primary and secondary data
6. investigate the effect of varying temperature on the resistance of a conductor using primary and secondary data
7. model resistances in series and parallel in electrical circuits using primary and secondary data
8. **derive** and use the formulae for resistors in series and parallel

### 3.4. Magnetic fields around permanent and temporary magnets

- the interaction of magnetic fields
- magnetic effect of an electric current
- force exerted by a magnetic field on a moving charge
  - $F = Bqv$
- the effect of a ferrous core on the magnetic field around a solenoid

1. model the relative strength and direction of magnetic fields around
  - a single permanent magnet and permanent magnets in close proximity
  - current carrying wire
  - current carrying solenoid with and without ferrous core
2. investigate the use of permanent and temporary magnets in real life situations using secondary sources

### 3.5. The force experienced by a current-carrying conductor in a magnetic field.

- Fleming's left-hand rule/right-hand rule to determine the direction of a motor effect force
  - $F = BIL$
- simple DC motor and the role of the split ring commutator

1. investigate the relationship between the magnetic field and the electromagnetic force on a current-carrying conductor
2. model the motor effect
3. model a DC motor

## Students learn about

### 3.6. Induced potential difference and the generator effect

- magnetic flux  $\Phi = BA$
- Faraday's law
- Lenz's law
  - $E = -\frac{d\Phi}{dt}$
- Mutual inductance in transformers
  - $\frac{V_s}{V_p} = \frac{N_s}{N_p}$
  - $I_p V_p = I_s V_s$
- electrical generation; A.C and D.C generators and their components
  - $V_{rms} = \frac{V_0}{\sqrt{2}}$
  - $I_{rms} = \frac{I_0}{\sqrt{2}}$

## Students should be able to

1. investigate the relationship between a change in magnetic flux on any induced emf and subsequent current flow in a conducting coil
2. model
  - the generator effect
  - ac and dc generators
  - transformers
3. investigate the use of induced potential difference in a variety of applications using secondary sources
4. solve problems involving the efficiency of transformers
5. investigate transmission losses in the National grid using secondary sources
6. investigate issues related to electrical generation and distribution using secondary sources

## Strand 4: Modern Physics Atomic and Nuclear

In this strand, students gain a deep appreciation of the evolving nature of physics as they turn their attention to the late 19th and early 20th centuries when unexplainable observations were challenging accepted theories and models. They learn how this period saw major developments in physics as experimental discoveries motivated by the need for explanations revolutionised the accepted understanding of the nature of matter on an atomic scale and led to a new area of study; namely quantum mechanics.

By studying the development of atomic models through the work of Thomson and Rutherford, who established the nuclear model of the atom – a positive nucleus surrounded by electrons – and Marie Curie who pioneered research on radioactivity, students further their understanding of the limitations of theories and models. They explore the contribution of Bohr and his demonstration of the quantum mechanical nature of matter as a better way to understand the structure of the atom. A quantum explanation of observed properties of

matter and light have inspired other great physicists such as de Broglie, Schrödinger and Heisenberg to develop more accurate models of matter, which in turn have been modified or abandoned in the light of further experimental investigations.

Students learn how experimental investigations of the nucleus have led to an understanding of the weak nuclear force responsible for the radioactive decay of certain nuclei, the ability to extract energy from nuclear fission and fusion, and a deeper understanding of the atomic model.

They explore how technologies arising from these theories have shaped the modern world. They look at modern instrumentation such as particle accelerators and how they have revealed that protons themselves are not fundamental and continue to provide evidence in support of the Standard Model of matter. In studying this strand, students can appreciate how the fundamental particle model is forever being updated and that our understanding of the nature of matter remains incomplete.

### Strand 4 Learning outcomes

#### Students learn about

##### 4.1. The electron

- the electron as the indivisible quantity of charge  $e = 1.602 \times 10^{-19} \text{ C}$
- hot cathodes (which are negative) producing cathode rays which were identified as beams of electrons
- beams of electrons being deflected in uniform electric and magnetic fields.
- electrons absorbed by metals.

#### Students should be able to

1. analyse evidence supporting the existence and properties of the electron
2. verify the basic principles of thermionic emission using secondary evidence
3. predict the deflection of a beam of electrons in an electric and magnetic field

## Students learn about

### 4.2. Photoelectric emission and X-Ray production

- electrons being ejected or released from the surface of materials (generally a metal) when light of a suitable frequency falls on them
- the wave theory of light and how it cannot account for the observed dependence of the photoelectric effect on frequency
  - $E = hf$
  - $\Phi = hf_0$ 
    - threshold frequency  $f_0$
    - work function  $\Phi$
- the principle of conservation of energy underpins the effect
  - $E = \Phi + \frac{1}{2}mv_{max}^2$
- the photoelectric effect and its applications in sensor technology
- beams of electrons incident on metal targets used to produce X-rays in X-ray tubes

### 4.3. Early models of the atom

- models proposed by Thompson-Rutherford-Bohr
- energy levels and quantum leaps
  - $E_2 - E_1 = hf$

### 4.4. Radioactivity

- detection of ionising radiation
- isotopes and nuclear stability, mass defect and binding energy
- ionising radiation: alpha particles, beta particles and gamma rays

## Students should be able to

1. use secondary data to verify the photoelectric effect and the effect of varying
    - the intensity of incident radiation
    - the frequency of incident radiation
  2. explain how photoelectric emission supports the particle model of light
  3. relate the photoelectric effect to the operation of a photocell
  4. investigate real life applications of the photoelectric effect using secondary sources
  5. compare x-ray production and the photoelectric effect
- 
1. model the atom and emission spectra of atoms
  2. appreciate how the analysis of emission spectra data has contributed to our understanding of the universe
- 
1. analyse evidence to support the existence of natural background radiation
  2. classify radioactive emissions in terms of their
    - relative ionising effects
    - relative penetrating powers
    - charge and mass
    - deflection in electric and magnetic fields

## Students learn about

- the safety implications of radioactive emissions
- $\alpha$ ,  $\beta$  and gamma decay
- **the strong and weak nuclear forces as two of the four fundamental forces of nature**
  - $A = -\frac{dN}{dt}$
  - $A = \lambda N$
  - $T_{\frac{1}{2}} = \frac{\ln 2}{\lambda}$

## Students should be able to

3. model spontaneous radioactive decay
4. **examine the model of half-life in radioactive decay and use it to solve problems involving the activity or the amount of a radioactive sample**

### 4.5. Mass energy equivalence

- splitting the nucleus
- $E = mc^2$
- accelerating particles
- the evolving standard model of matter
  - fermions (quarks and leptons) and bosons
  - matter and anti-matter

1. analyse Cockcroft and Walton's experiment and appreciate its significance as the first nuclear transformation by artificially accelerated particles
2. describe matter in terms of fundamental particles and their anti-particles using secondary sources
3. describe how forces are communicated between fundamental particles using secondary sources

### 4.6. Harnessing energy from nuclear processes

- $E = mc^2$
- **controlled/uncontrolled chain reactions**
- **positron-electron annihilation**

1. **describe nuclear fission, nuclear fusion and particle-antiparticle interactions**
2. evaluate evidence about issues related to nuclear fission and fusion in electrical generation using secondary sources

## Teaching for student learning

Senior cycle students are encouraged to develop the knowledge, skills, values and dispositions that will enable them to become more independent in their learning and to develop a lifelong commitment to improving their learning.

Leaving Certificate Physics supports the use of a wide range of teaching and learning approaches. The course is student-centred in its design and emphasises a practical experience of physics for each learner. As students progress, they will develop competencies that are transferable across different tasks and different disciplines, enabling them to make connections between physics, other subjects, and everyday experiences.

Modelling is at the heart of what physicists do, therefore, it is important that students learn to verify established models and to use words, diagrams, numbers, graphs and equations, where appropriate, to simplify complex systems, explain phenomena, make justified predictions and to provide justified solutions to problems. Scientific practices are best learned by doing, and in planning for teaching and learning, teachers should provide ample opportunity for students to engage with the scientific practices set out in a unifying strand. Whilst contextual strands set out situations where students are required to gather primary data to verify observations and mathematical relationships, this is a minimum requirement and it is not expected that practical opportunities would be limited to these situations.

Through the cross-cutting themes, students will integrate their knowledge and understanding of physics with the ethical, social, economic and environmental implications and applications of physics. Increasingly, arguments between scientists extend into the public domain. By critically evaluating scientific texts and debating public statements about science, students will engage with contemporary issues in physics that affect their everyday lives. They will learn to interrogate and interpret data—primary data, that they collect themselves as well as secondary data collected by others—a skill which has a value far beyond physics wherever data are used as evidence to support argument. By providing an opportunity to examine and debate reports about contemporary issues in science, Leaving Certificate Physics will enable students to develop an appreciation of the social context of science. They will develop skills in scientific communication by collaborating to generate perspectives and present them to their peers.

Leaving Certificate Physics provides numerous opportunities for teachers to teach the subject and select materials that respond to the needs, strengths and interests of all students. The focus on an inquiry-based approach to teaching and learning, which is central to physics, means that Leaving Certificate Physics students can be engaged in learning activities that complement their strengths and needs. The course allows for the selection and exploration of topics in ways that are of most interest and relevance to students.

The variety of activities that students engage in will enable them to take charge of their own learning by setting goals, developing action plans, and receiving and responding to assessment feedback. Students vary in the amount and type of support they need to be successful. Levels of demand in any learning activity will differ as students bring different ideas and levels of understanding to it. The use of strategies such as adjusting the level of skills required, varying the amount and the nature of teacher intervention, and varying the pace and

sequence of learning promotes inclusivity. As well as varied teaching strategies, varied assessment strategies will support learning and provide information that can be used as feedback so that teaching and learning activities can be modified in ways that best suit individual students. By setting appropriate and engaging tasks, asking questions of varying cognitive demand and giving feedback that promotes learner autonomy, assessment will support learning as well as summarising achievement.

---

## Digital technology

Digital technology can enhance learning, teaching and assessment, creating opportunities for students to develop scientific knowledge and skills and digital media literacy in ways that cannot be achieved without the use of technology. As students engage with Leaving Certificate Physics they have opportunities to use digital technology in a range of ways. For example, they may use digital technology to:

- collect, record, analyse and display data and information appropriately
- visualise the core concepts, models and theories that describe, explain and predict physical phenomena
- access and analyse large datasets (e.g. databases of speed, distance and time information) in ways that non-digital techniques of data collection/analysis cannot
- develop a deeper understanding of data through choosing the right tools for data collation, visualisation, analysis, and representation of results
- develop and improve investigative research, communication, and report writing skills
- become more independent learners through, for example, appropriate online supports
- enhance their experience in the physics laboratory
- develop their understanding of how physicists use digital technology in their work.

## Assessment

Assessment in senior cycle involves gathering, interpreting, using and reporting information about the processes and outcomes of learning. It takes different forms and is used for a variety of purposes. It is used to determine the appropriate route for students through a differentiated curriculum, to identify specific areas of strength or difficulty for a given student and to test and certify achievement. Assessment supports and improves learning by helping students and teachers to identify next steps in the teaching and learning process.

As well as varied teaching strategies, varied assessment strategies will support student learning and provide information to teachers and students that can be used as feedback so that teaching and learning activities can be modified in ways that best suit individual learners. By setting appropriate and engaging tasks, asking questions and giving feedback that promotes learner autonomy, assessment will support learning and promote progression, support the development of student key competencies and summarise achievement.

## Assessment for certification

Assessment for certification is based on the rationale, aims and learning outcomes of this specification. There are two assessment components: a written examination and an additional assessment component comprising a Physics In Practice Investigation. The written examination will be at higher and ordinary level. The Physics In Practice Investigation will be based on a common brief. Each component will be set and examined by the State Examinations Commission (SEC).

In the written examination, Leaving Certificate Physics will be assessed at two levels, Higher and Ordinary (Table 2). Examination questions will require students to demonstrate learning appropriate to each level. Differentiation at the point of assessment will also be achieved through the stimulus material used, and the extent of the structured support provided for examination students at different levels.

Assessment component	Weighting	Level
Physics In Practice Investigation	40%	Common brief
Written examination	60%	Higher and Ordinary level

Table 2: Overview of assessment for certification

## Additional assessment component: Physics in Practice Investigation

The Physics in Practice Investigation provides an opportunity for students to display evidence of their learning throughout the course, in particular, the learning set out as outcomes in the unifying strand. It involves students completing a piece of work during the course and, in Year 2, submitting for marking to the State Examinations Commission (SEC), evidence of their ability to conduct scientific research on a particular issue and to use appropriate primary data to investigate aspects of that issue. It has been designed to be naturally integrated into the flow of teaching and learning and to exploit its potential to be motivating and relevant for students, to draw on selected learning outcomes and cross-cutting themes from the course and to highlight the relevance of learning in Physics to their lives.<sup>4</sup>

The Physics in Practice Investigation provides opportunities for students to pursue their interests in Physics, to make their own investigative decisions, acquire a depth of conceptual understanding and self-regulate their own learning.

### Investigation brief

An *Investigation Brief* will be published annually by the SEC in term two of year one of the course. As well as setting out the specific requirements of the Physics in Practice Investigation, the brief will:

- allow students to develop their thinking and ideas on areas they would like to pursue, related to the brief
- facilitate teachers and students in their planning
- include stimulus material to set a context for the investigation
- allow students to develop an investigative log that they can draw upon as they complete their investigation.

Building on their learning to date, students will learn more about the nature of investigation through research and experimentation. Students should be empowered in realising that research and experimentation is more about engaging with and learning from the process, rather than focusing on the final product. Students should give an authentic account of how their investigative work unfolds, discuss and explain the outcomes of their investigation and how they might revise aspects of the process.

To complete the Physics in Practice Investigation, students carry out the following.

- Scientific research on an issue related to the brief. They gather, process and evaluate information from secondary sources. The knowledge gained from this phase of the investigation may help to inform their experimental work.
- An experiment related to an issue within the brief. They generate a hypothesis, plan, and design their experiment. They carry out their experiment and gather primary data. Once they have gathered their primary data, they analyse the data and form conclusions.

Students develop an evidence-based argument in response to the brief. Upon completion, students submit a report of their investigation in Year 2 in a format prescribed by the SEC.

Schools have a high degree of autonomy in planning and organising the completion of the investigation. A separate document, *Guidance to Support the Completion of the Physics in Practice Investigation*, gives guidance on a range of matters related to the organisation, implementation, and oversight of the investigation.

<sup>4</sup> It is envisaged that the AAC will take up to 20 hours to complete. Further details will be provided in the *Guidelines to support the Physics In Practice Investigation*.

## Descriptors of quality for the Physics in Practice Investigation

The descriptors below relate to the learning achieved by students in the Physics in Practice Investigation.

In particular, the investigation requires students to:

- consider issues related to real-world applications of physics
- demonstrate investigative skills
- relate their investigative work to the work of scientists in society
- communicate their findings appropriately and effectively.

	Students demonstrating a high level of achievement	Students demonstrating a moderate level of achievement	Students demonstrating a low level of achievement
<b>Knowledge understanding</b>	engage thoroughly with the concepts being investigated; describe clearly the purpose of the investigation; describes accurately, using appropriate means, the physical phenomena involved.	engage with the concepts being investigated; describe the purpose of the investigation and the physical phenomena involved.	have limited engagement with the concepts being investigated and make little attempt to outline the physical phenomena involved.
<b>Investigating</b>	use a large number of varied, balanced and referenced sources; where appropriate pose a testable hypothesis that is underpinned by physics theory; use a clear investigative design and thorough appropriate methods to collect high quality primary data and evaluate the reliability of any secondary sources used; draw valid conclusions justified by evidence.	use a number of balanced mostly referenced sources; where appropriate pose a testable hypothesis that is underpinned by physics theory; use an investigative design and appropriate methods to collect good quality primary data and considers the reliability of any secondary sources used; draw conclusions that relate to any hypotheses made and identify potential sources of error in the investigative design; reflect on what worked and did not work.	use some referenced sources; where applicable pose a testable hypothesis supported by the teacher; use investigate design and methods to collect primary data that are unclear and make little effort to consider the reliability of any secondary sources used; draw limited conclusions and fail to identify potential sources of error in the investigative design; give an incoherent, illogical, or idealised reflection.
<b>Communicating</b>	design an investigation that leads to high quality data presentation and analysis; include, at their own initiative, new directions or approaches to experimentation and research as the work progresses.	design an investigation that leads to good quality data presentation and analysis; consider minor extensions or alterations to the plan.	design an investigation that leads to limited data presentation and analysis; show no evidence of on- going reflection.
<b>Relating to society</b>	offer a considered reflection locating the outcomes of the investigation within broader issues relating to the real world.	reflect on how the outcomes of the investigation relate to real world issues.	makes limited links between the outcomes of the investigation and real-world issues.

Table 3: Descriptors of Quality: Physics in Practice Investigation

## Written examination

The written examination will consist of a range of question types. The senior cycle key competencies (figure 2) are embedded in the learning outcomes and will be assessed in the context of the learning outcomes. The written examination paper will include a selection of questions that will assess, appropriate to each level:

- the learning described in the four contextual strands of the specification and the unifying strand
- application of physics to issues relating to the cross-cutting themes—sustainability, health, and technology.

## Reasonable accommodations

This Leaving Certificate Physics specification requires that students engage with the nature of the subject on an ongoing basis throughout the course. The assessment for certification in Leaving Certificate Physics involves a written examination worth 60% of the available marks and an additional component worth 40%. In this context, the scheme of Reasonable Accommodations, operated by the State Examinations Commission (SEC), is designed to assist students who would have difficulty in accessing the examination or communicating what they know to an examiner because of a physical, visual, sensory, hearing, or learning difficulty. The scheme assists such students to demonstrate what they know and can do, without compromising the integrity of the assessment. The focus of the scheme is on removing barriers to access, while retaining the need to assess the same underlying knowledge, skills, values, and dispositions as are assessed for all other students and to apply the same standards of achievement as apply to all other students. The Commission makes every effort when implementing this scheme to accommodate individual assessment needs through these accommodations.

There are circumstances in which the requirement to demonstrate certain areas of learning when students are being assessed for certification can be waived or exempted, provided that this does not compromise the overall integrity of the assessment.

More detailed information about the scheme of Reasonable Accommodations in the Certificate Examinations, including the accommodations available and the circumstances in which they may apply, is available from the State Examinations Commission's Reasonable Accommodations Section.

Before deciding to study Leaving Certificate Physics students, in consultation with their school and parents/guardians should review the learning outcomes of this specification and the details of the assessment arrangements. They should carefully consider whether or not they can achieve the learning outcomes, or whether they may have a special educational need that may prevent them from demonstrating their achievement of the outcomes, even after reasonable accommodations have been applied. It is essential that if a school believes that a student may not be in a position to engage fully with the assessment for certification arrangements, they contact the State Examinations Commission.

## Leaving Certificate Grading

Leaving Certificate Physics will be graded using an 8-point grading scale. The highest grade is a Grade 1; the lowest grade is a Grade 8. The highest seven grades (1-7) divide the marks range 100% to 30% into seven equal grade bands 10% wide, with a grade 8 being awarded for percentage marks of less than 30%. The grades at Higher level and Ordinary level are distinguished by prefixing the grade with H or O respectively, giving H1-H8 at Higher level, and O1-O8 at Ordinary level.

Grade	% marks
H1/O1	90 – 100
H2/O2	80 < 90
H3/O3	70 < 80
H4/O4	60 < 70
H5/O5	50 < 60
H6/O6	40 < 50
H7/O7	30 < 40
H8/O8	< 30

Table 4: Leaving Certificate grading

## Appendix 1: Glossary of action verbs

Action verb	Students should be able to
<b>Analyse</b>	study or examine something in detail, break down in order to bring out the essential elements or structure; identify parts and relationships, and to interpret information to reach conclusions
<b>Apply</b>	select and use information and/or knowledge and understanding to explain a given situation or real circumstances
<b>Appreciate</b>	recognise the meaning of, have a practical understanding of
<b>Calculate</b>	obtain a numerical answer showing the relevant stages in the working
<b>Classify</b>	group things based on common characteristics
<b>Compare</b>	give an account of the similarities and (or) differences between two (or more) items or situations, referring to both (all) of them throughout
<b>Define</b>	give the precise meaning of a word, phrase, concept or physical quantity
<b>Demonstrate</b>	prove or make clear by reasoning or evidence, illustrating with examples or practical application
<b>Derive</b>	arrive at a statement or formula through a process of logical deduction; manipulate a mathematical relationship to give a new equation or relationship
<b>Describe</b>	develop a detailed picture or image of, for example a structure or a process, using words or diagrams where appropriate; produce a plan, simulation or model
<b>Determine</b>	obtain the only possible answer by calculation, substituting measured or known values of other quantities into a standard formula
<b>Discuss</b>	offer a considered, balanced review that includes a range of arguments, factors or hypotheses; opinions or conclusions should be presented clearly and supported by appropriate evidence
<b>Estimate</b>	give a reasoned order of magnitude statement or calculation of a quantity
<b>Evaluate (data)</b>	collect and examine data to make judgments and appraisals; describe how evidence supports or does not support a conclusion in an inquiry or investigation; identify the limitations of data in conclusions; make judgments about the ideas, solutions or methods
<b>Evaluate (ethical judgement)</b>	collect and examine evidence to make judgments and appraisals; describe how evidence supports or does not support a judgement; identify the limitations of evidence in conclusions; make judgments about the ideas, solutions or methods
<b>Explain</b>	give a detailed account including reasons or causes
<b>Examine</b>	consider an argument or concept in a way that uncovers the assumptions and relationships of the issue
<b>Explore</b>	observe or study in order to establish facts
<b>Identify</b>	recognise patterns, facts, or details; provide an answer from a number of possibilities; recognise and state briefly a distinguishing fact or feature
<b>Illustrate</b>	use examples to describe something
<b>Investigate</b>	observe, study, or make a detailed and systematic examination, in order to establish facts and reach new conclusions
<b>Justify</b>	give valid reasons or evidence to support an answer or conclusion
<b>Measure</b>	quantify changes in systems by reading a measuring tool

Action verb	Students should be able to
<b>Model</b>	make justified predictions, describe phenomena and solve problems using words/diagrams/numbers/graphs/equations as appropriate
<b>Outline</b>	give the main points; restrict to essentials
<b>Pose</b>	put forward for consideration
<b>Predict</b>	give an expected result of an event; explain a new event based on observations or information using logical connections between pieces of information
<b>Prove</b>	use a sequence of logical steps to obtain the required result in a formal way
<b>Provide evidence</b>	provide data and documentation that support inferences or conclusions
<b>Recognise</b>	identify facts, characteristics or concepts that are critical (relevant/appropriate) to the understanding of a situation, event, process or phenomenon
<b>Recall</b>	remember or recognise from prior learning experiences
<b>Relate</b>	associate, giving reasons
<b>Use</b>	apply knowledge or rules to put theory into practice
<b>Verify</b>	give evidence to support the truth of a statement
